01 / PRODUCT OVERVIEW

Glasgow Salon Booking

One shared diary. Two clear experiences.

A customer and shop booking prototype for a Glasgow salon, translating scattered chat coordination and a paper diary into a service-aware appointment workflow.

Local shared prototype · field research planned

MY CONTRIBUTION

Problem framing, service flow, UI and AI-assisted prototyping

Actual prototype screens · simulated content

02 / FRAMING

How might booking stay simple when service lengths and opening hours change?

Existing background notes describe an owner-managed salon coordinating appointments through WeChat and a paper diary. Scattered records, varying service lengths and manual schedule changes motivate the prototype. These notes establish the context; they are not a completed interview study.

DESIGN OBJECTIVES

01 Reduce repeated messages about available times.

02 Fit the complete service into a valid opening window.

03 Preserve affected appointments when the shop changes its schedule.

Customer

Choose a service and time, understand the duration, then find and change the appointment.

Shop owner

See the day, enter a manual booking, adjust opening hours and resolve affected appointments.

Different entry habits

The brief includes Chinese and non-Chinese customers. Language and access requirements still need validation; the current demo is not a verified multilingual release.

EVIDENCE & LIMITS

Current basis: project background and pain-point notes, a design-logic framework, navigation review and local implementation/self-test records. No on-site observation, interview or field usability test has been completed. Opening hours, services and bookings in the demo are fixtures.

03 / STRUCTURE & FLOW

From navigation to a complete task

Customer · three-step booking

L1 · Service + date / My bookings

L2 · Legal start times / appointment detail

L3 · Review and confirm / reschedule / cancel confirmation

Shop · task-based navigation

L1 · Today / Diary / Availability / More

L2 · Day detail / affected bookings / weekly opening rules

L3 · Add or edit appointment / temporary closure / restore availability

This reflects the current customer preview and connected full shop interface. Date and fixed-time filtering are modes within the first step, rather than additional page levels.

01 / Choose

Select a service and available date.

02 / Check

See starts that fit the full duration.

03 / Confirm

Review service, duration and local time.

04 / Manage

Find the same appointment in My bookings and the shop diary.

05 / Recover

If hours change, retain the booking and arrange a new time.

04 / CORE JOURNEY

Read the product without opening the demo

01 / Service and date

Service duration is visible before choosing a day. Earliest availability and date status make the next action clear, while unavailable dates remain explicit.

02 / A valid start time

Only starts that accommodate the whole service are offered. The detailed diary is expandable, keeping the main choice compact.

03 / Check before committing

Date, start and end, service and duration are brought together. The page explicitly identifies the booking as a local preview.

05 / THE COMPLETE SERVICE

Beyond a single screen

04 / The shared diary

The shop sees appointments against the day, rather than reconstructing them from messages. Customer and shop actions use one booking core.

05 / Rules and exceptions

Weekly opening rules, the future booking horizon and temporary closures are separated, so recurring settings are not confused with a one-off change.

06 / Preserve affected bookings

A temporary closure communicates that existing appointments remain visible and need rescheduling. The interface does not imply a real notification has been delivered.

06 / DESIGN DECISIONS

The logic behind the interface

01

Duration drives availability

An empty start time alone does not guarantee space for a long service.

PROTOTYPE RESPONSE

Check the full interval against opening windows, breaks and other appointments.

NEXT VALIDATION

Test short and long services near breaks and closing time.

02

One shared state

Separate calendars create conflicting versions of the same appointment.

PROTOTYPE RESPONSE

Customer and shop views use a shared local booking core and in-memory data source.

NEXT VALIDATION

Compare both views after booking, rescheduling, cancellation and a shop-side change.

03

Recover rather than erase

Deleting an affected booking would hide an unresolved customer commitment.

PROTOTYPE RESPONSE

Keep the record visible in an affected / reschedule state; preserve context during recovery.

NEXT VALIDATION

Ask the owner to close a period and explain which customers still need action.

07 / RESEARCH PLAN

Take the prototype into the field

Planned activities. No interviews or field tests completed yet.

01 / Observe a real booking

With permission, map how a request moves from a conversation to the diary, including changes and interruptions. Record steps without retaining private customer details.

02 / Validate the operating rules

Confirm service lengths, opening windows, same-day policy, buffers and preferred language with the owner. Demo fixtures are not final business rules.

03 / Test both sides of a change

Ask a customer to book and reschedule, then ask the owner to adjust a period and identify affected appointments. Record completion, errors, time and assistance.

EVIDENCE TO ADD AFTER FIELDWORK

Site photographs & observation

Add consented photos with date, setting and the workflow observed.

Interview findings

Add anonymised notes, participant context and the insight supported.

Testing & iteration

Connect a task and observed issue to a design change and a retest.

08 / PROGRESS & NEXT STEPS

Prototype today. Evidence-led release next.

Now · customer and full shop interfaces connected locally

Next · owner interview, observation and two-sided task testing

Then · refine service rules and run an agreed limited pilot

Before release · persistent data, identity, notification delivery and recovery checks

CURRENT BOUNDARIES

The portfolio runs an isolated build of the existing customer and full shop source. Both use a local shared service; restarting it resets in-memory appointments. CloudBase persistence, real WeChat identity, reliable notifications and production deployment are unfinished. No real customer is charged or notified.

TRY THE PROTOTYPE

Choose a service → an available day → a start time → review. Confirm only a simulated appointment, then open the shop view to inspect the same date. Try My bookings for rescheduling and cancellation. All data are local fixtures.

Local review prototype. No verified business impact is claimed. A public demo link will follow approved release.
