01 / PRODUCT OVERVIEW

LOOK - Beauty Marketplace

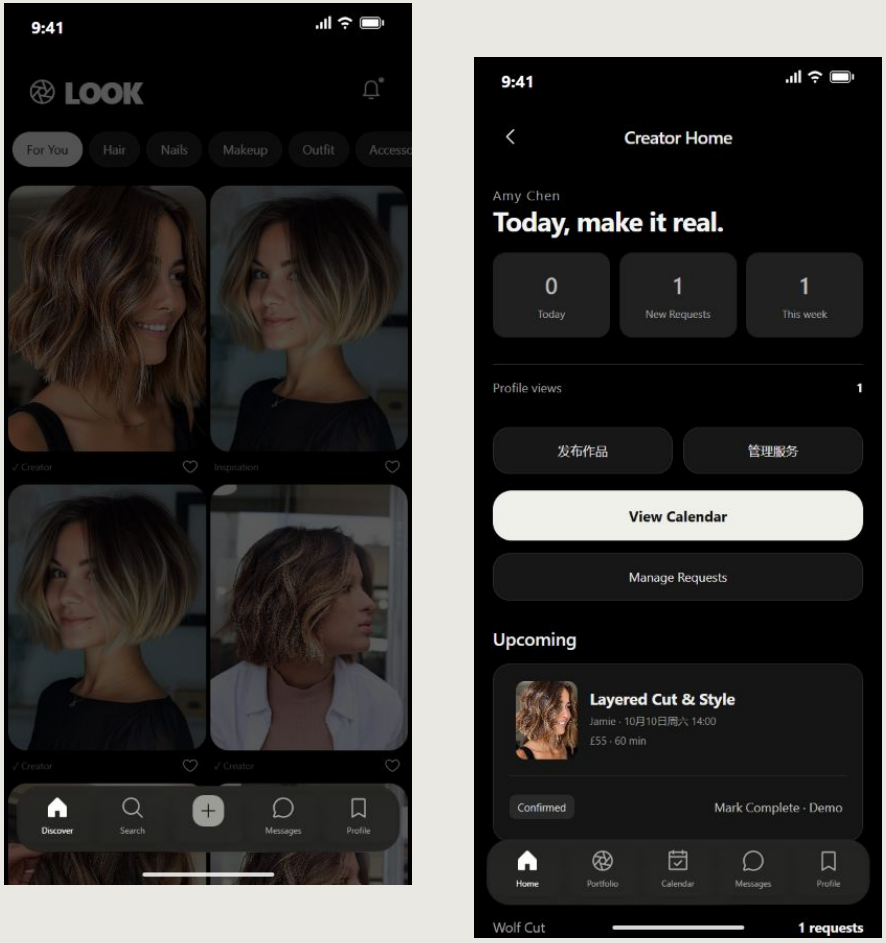

From visual inspiration to a bookable local service.

A two-sided mobile product exploring how people communicate a desired look, assess local Creators and move towards a service appointment.

Interactive prototype · field research planned

MY CONTRIBUTION

Product framing, experience design and AI-assisted prototyping

Actual prototype screens · simulated content

02 / FRAMING

How might a saved image become a clear, realistic service request?

LOOK starts with a product hypothesis: visual inspiration and local service booking often require different kinds of information. The prototype connects the desired look with actual work, service scope, location, consultation and availability. The demand and provider workflow still need field validation.

DESIGN OBJECTIVES

01 Make a visual preference easier to explain.

02 Help people judge relevant local work before committing.

03 Connect the request to a manageable Creator workflow.

Consumer

Collect inspiration, combine a look, compare relevant work and confirm service details.

Creator

Present actual work, clarify services, handle requests and manage availability.

Pilot operator

Define the initial local supply, onboarding and trust requirements. This role is a planning lens, not an existing operations dashboard.

EVIDENCE & LIMITS

Current basis: the existing whole-product demo, its product specification and a Glasgow logic/business review. No interview, observation or field usability study has been completed. Screens show simulated accounts and content, rather than real customer outcomes.

03 / STRUCTURE & FLOW

From navigation to a complete task

Consumer navigation

L1 · Discover / Search / Build / Messages / Profile

L2 · Look detail / saved board / matches / Creator profile / conversations

L3 · Add to Look / edit tags / choose service and time / booking actions

Creator navigation

L1 · Home / Portfolio / Calendar / Messages / Profile

L2 · Requests / work details / appointments / service settings

L3 · Reply / confirm or decline / update availability / publish work

A map of the current prototype, organised by navigation, detail and action depth. Labels do not imply three separate apps. Interview findings may change this hierarchy.

01 / Discover

Browse and save a look.

02 / Define

Inspect the detail or combine a personal board.

03 / Compare

Filter nearby Creators and relevant portfolio work.

04 / Consult & book

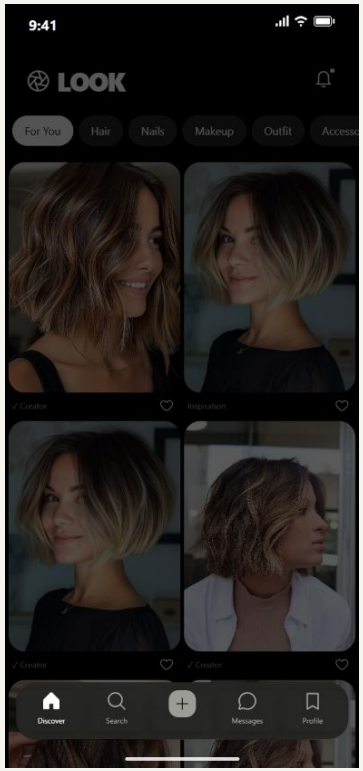

Clarify feasibility, select a service and check a time.

05 / Follow through

Track the request; the Creator manages the same booking.

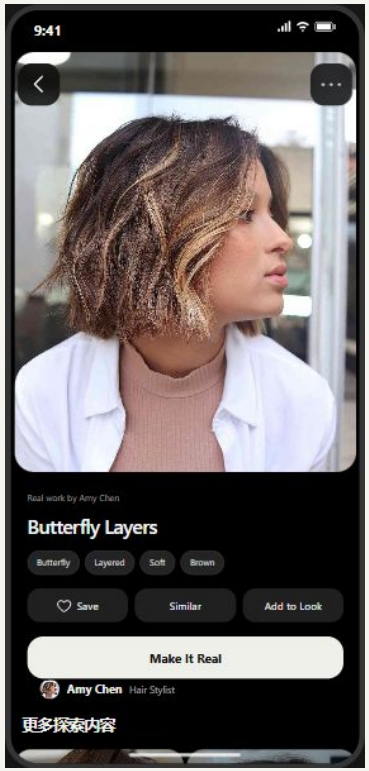

04 / CORE JOURNEY

Read the product without opening the demo

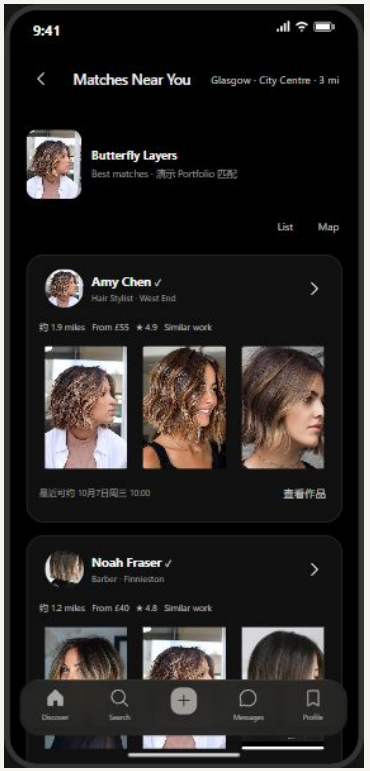

01 / Visual discovery

Images lead the browse experience. Inspiration and Creator work have distinct labels, so a reference image does not silently become a provider claim.

02 / A reference with context

Save, Similar, Add to Look and Make It Real serve different intentions. Work attribution stays visible before the user moves towards a service.

03 / Compare local evidence

Relevant work, area, indicative price and availability appear together. Similar work and Same category remain distinct; ratings and distances here are demonstration data.

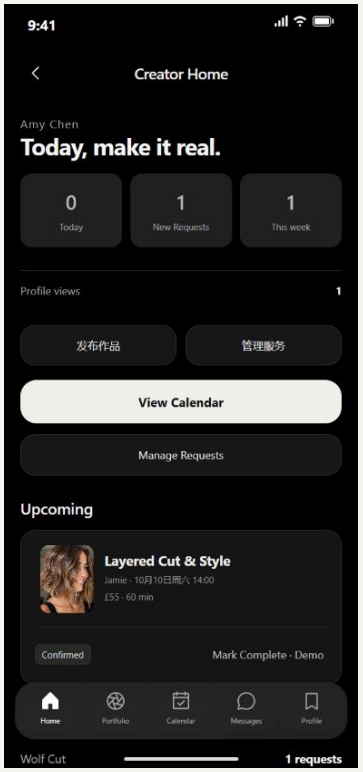

05 / THE COMPLETE SERVICE

Beyond a single screen

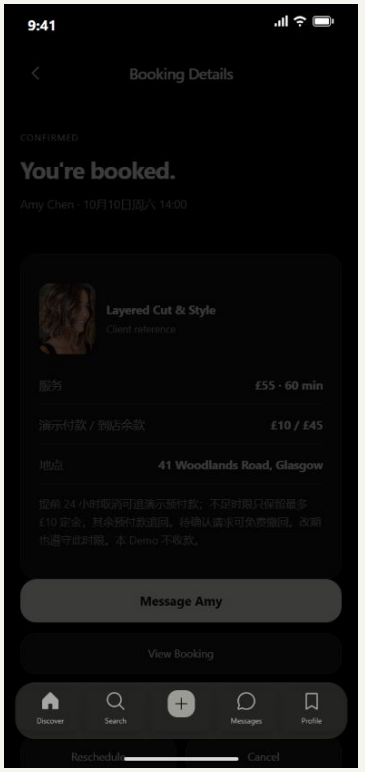

04 / Express a complete look

A personal board separates hair, makeup, clothing and accessories. The preview is a collage; it is not an AI try-on or a promised service result.

05 / The other side of the service

A dedicated Creator experience organises requests, portfolio, services and calendar, rather than treating the product as a consumer gallery alone.

06 / A traceable booking

The simulated booking connects the chosen look, service and provider. Its state is available to the matching Creator account in the same browser.

06 / DESIGN DECISIONS

The logic behind the interface

01

Location before ranking

An attractive match outside the chosen area cannot solve a local service need.

PROTOTYPE RESPONSE

Apply the distance filter before tag-based ranking; offer an editable area when location access is unavailable.

NEXT VALIDATION

Check whether participants understand the area limit and find relevant options.

02

Matching is not feasibility

Similar images alone cannot establish provider capability, price or time.

PROTOTYPE RESPONSE

Keep work attribution and match labels explicit; connect selection to consultation and confirmation.

NEXT VALIDATION

Check whether people distinguish inspiration, provider work and a confirmed service.

03

Keep both sides consistent

Availability and price can change between browsing and booking.

PROTOTYPE RESPONSE

The demo rechecks booking conditions and keeps pending requests visible. Chat, payment and identity remain simulated.

NEXT VALIDATION

Test stale information, unavailable slots and declined requests before a real pilot.

07 / RESEARCH PLAN

Take the prototype into the field

Planned activities. No interviews or field tests completed yet.

01 / Explore the real journey

Ask consumers how they collect references, explain a look and decide whom to trust. Capture consented journey notes and anonymised examples.

02 / Observe provider work

Discuss consultation, feasible requests, pricing and diary management with local providers. Record actual constraints before narrowing the pilot.

03 / Test one complete task

Ask a participant to turn a chosen look into a suitable service request. Record completion, hesitation, misunderstood labels and recovery from no matches.

EVIDENCE TO ADD AFTER FIELDWORK

Site photographs & observation

Add consented photos with date, setting and the workflow observed.

Interview findings

Add anonymised notes, participant context and the insight supported.

Testing & iteration

Connect a task and observed issue to a design change and a retest.

08 / PROGRESS & NEXT STEPS

Prototype today. Evidence-led release next.

Now · connected whole-product mobile demo

Next · interviews, observation and task-based testing

Then · refine a limited local provider pilot

Before release · real identity, provider onboarding, privacy, payments and notifications

CURRENT BOUNDARIES

Creator identities, reviews, distances, payments and messages are simulated. Matching uses tags and rules; style preview is a collage. Browser storage does not provide production authentication or cross-device sync. A separate, narrower V1 includes persistent APIs and an iOS source project, but is not a launched product.

TRY THE PROTOTYPE

Choose the Consumer role and a preset demo name. Open a look → Make It Real → nearby Creators → service and availability. Switch to the matching Creator from Profile to inspect the same request. No real phone number or payment is needed.

Local review prototype. No verified business impact is claimed. A public demo link will follow approved release.
