Digital Products & UX / Service & Transformation

Glasgow Salon Booking

One shared diary. Two clear experiences.

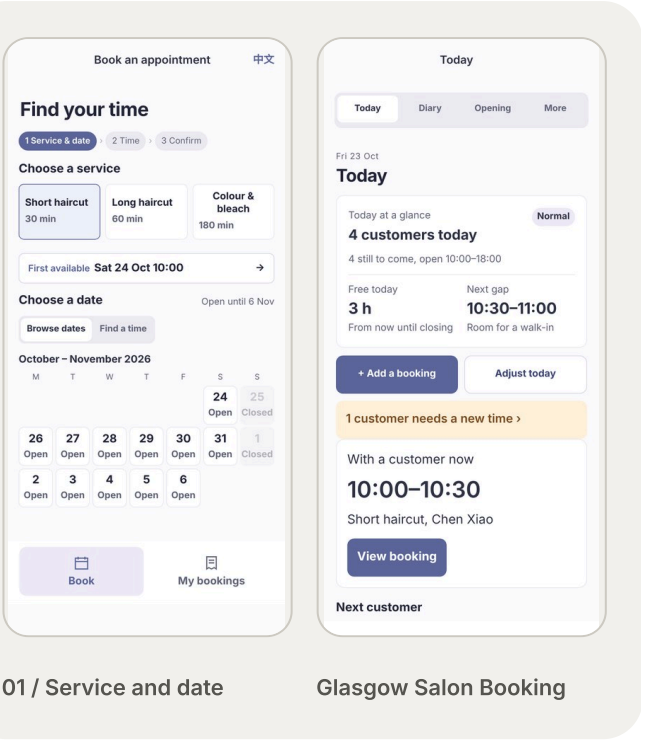

A customer and shop booking system for a small Glasgow salon run by an older owner, who currently manages every appointment through WeChat, a paper diary and memory.

Live since October 2026 · web version in Chinese and English, with an owner admin

Try the interactive prototype: **yifan-zhu-portfolio-2026.vercel.app/demos/salon-booking/**

Visit the live site ↗

This is the shop's real booking site, used by real customers. To try it freely, use the prototype here instead: it runs the same rules on sample data.

01 / Service and date — Glasgow Salon Booking

MY CONTRIBUTION	Problem framing, service blueprint, booking rules, UI for both sides and AI-assisted prototyping
SCOPE	Customer booking + shop diary and availability
TYPE	Service design · booking system
STAGE	Live web version, launched 21 Oct 2026
BUILT WITH	TypeScript booking core, Cloudflare Pages + D1, Google sign-in; AI-assisted within rules

The aim is not to put booking online. It is to let the routine run itself, so the owner only steps in for the exceptions — without learning a complicated tool.

01 / The problem

How might every customer book easily — without adding work for the owner?

Everything lives in one person

WeChat + paper diary + memory.

One long service delays everyone after it

Times were written down; durations were not.

Plans change — and every change means messaging everyone

Illness or travel = messaging everyone again.

Customers have to ask before they can book

No WeChat, no easy way in.

The owner

Runs the salon alone | WeChat + paper diary | Hours change with health and travel | Away for two weeks recently | Needs tools she can read at a glance

"Is anyone booked on Friday? Who do I need to tell?"

Same booking, different questions

Customer asks

What services? | Which days are open? | Which times are free? | What did I book?

One shared diary

Owner asks

How many today? | Who, when, what, how long? | Where is free time? | Who is affected if I close?

Three users, three ways in

Chinese customers

Chinese website · live (mini program later)

Open → | Service → | Time → | Confirm

Non-WeChat customers

English website · live; owner can still add them

Open the link → | Service & time → | Google sign-in → | Same diary

Owner

Shop view

Today → | Set hours once → | Handle exceptions

Where this stands

> Built from my background and pain-point notes on the salon, a booking-logic specification and self-tests, and now live as a website. A structured interview and on-site observation with the owner come next; services, hours and bookings in the demo here are sample data.

Customer

Choose a service and time, understand the duration, then find and change the appointment.

Shop owner

See the day, enter a manual booking, adjust opening hours and resolve affected appointments.

Customers without WeChat

Considered from the start; the English website now gives them their own way in, and the owner can add phone or walk-in customers by name, with no account needed.

---

02 / How the system works

Service blueprint: who does what

Routine work moves to the system. The owner acts in only two places.

Customer

Choose · Picks a service

Find a time · By date or fixed time

Book · Confirms

Before visit · Confirmation + day-before reminder

Visit · Arrives

Exception · Rebooks, service kept

Owner

Choose · —

Find a time · Sets hours once

Book · Nothing

Before visit · Nothing

Visit · Just cuts hair

Exception · Closes a day once

System

Choose · Knows its duration

Find a time · Only times that fit

Book · Rechecks — no double booking

Before visit · Sends WeChat reminders

Visit · Status updates itself

Exception · Moves bookings to “reschedule”

When the owner suddenly can’t open

1. Customer books 13:00
2. Owner closes 13:00–14:00
3. Booking becomes “to reschedule”
4. Customer picks a new time, service kept
5. Owner’s diary updates

Tested end to end across both sides of the prototype.

03 / Design principles

Booking rules that protect the owner

01
The routine runs itself
Owner handles exceptions only.

02
Duration decides availability
150-min gap: yes to a cut, no to a colour.

03
Only valid start times
No “17:45” — the day stays unfragmented.

04
Recommend, don’t decide
Suggested times reduce effort; any valid time stays open.

05
“Not open yet” ≠ “full”
Owner sets how far ahead to open; no same-day bookings.

06
Protect long gaps
Fill small gaps; keep big blocks free.

07

08

Never delete a booking

Closures move bookings to rescheduling.

Low learning cost

Starts from “today”, like her paper diary.

Deliberately not in V1

~~Online payment~~ ~~Coupons & points~~ ~~Multiple shops~~ ~~Parallel services~~ ~~No-show penalties~~ ~~AI chat~~

---

04 / Process & iteration

How I worked

01 Pain points → 02 V1 scope → 03 Three user flows → 04 Rules + AI guardrails → 05 Build & test

---

Booking rules, data contract and what the AI may change were fixed before any code was written.

Customer flow

BEFORE
One long schedule list on the home screen

→

AFTER
Three steps: week overview → valid times → confirm

Detailed diary folded away; Back keeps the selection.

Owner’s side

BEFORE
About 10 scattered settings pages

→

AFTER
4 time-first tabs: Today · Diary · Availability · More

“No-show” moved under more actions, so the routine stays automatic.

Two developers, one core

BEFORE
Customer and owner sides built separately

→

AFTER
One shared booking core, changes agreed first

e.g. how the owner adds a non-WeChat customer was raised as a change request.

After launch: one product, not two

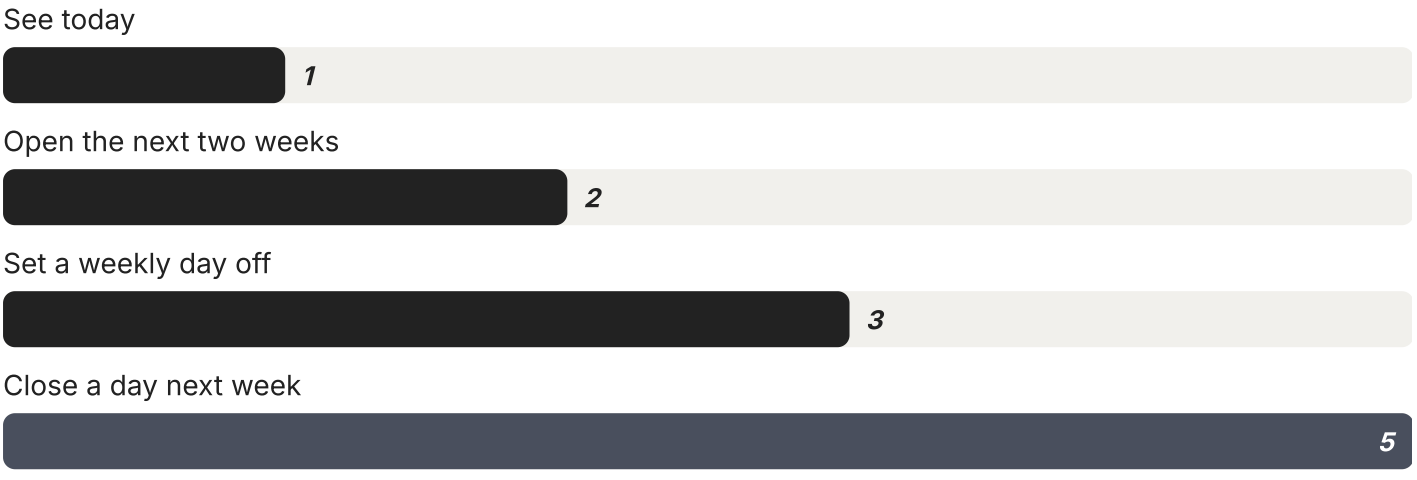

BEFORE
English pages were a separate, older interface; time off meant one day at a time; walk-ins needed an account

→

AFTER
One set of screens with an English text layer; several days off at once or a 15-minute timeline; walk-ins added by name and phone

Found by walking every flow on the live site myself; in the public demo now, and goes live with the next deploy.

Owner tasks, measured in taps

Target: 3–4 taps. Closing a future day took 6 at launch; the post-launch redesign brings it to 5, including one confirmation — still one over target.

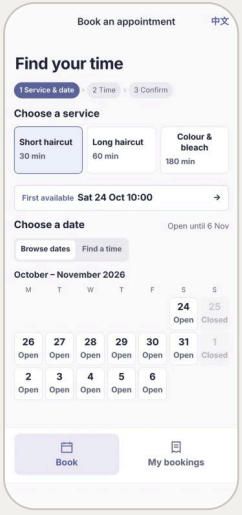

Evidence

Design reviews and automated tests (82 at prototype stage, 103 at launch, 107 after the post-launch fixes), including the full cross-side closure scenario. Not yet tested in a structured session with the owner herself.

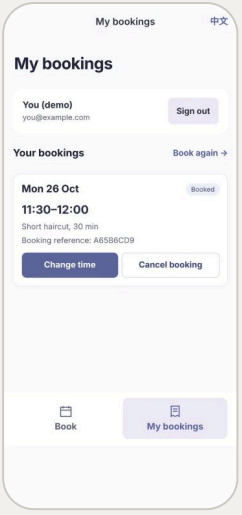

05 / Screen map

Captured from the public demo, which runs the live website's own screens on sample data. Level 1 is the main navigation; each row follows one path deeper. Select any screen to enlarge it.

L1 Tab bar

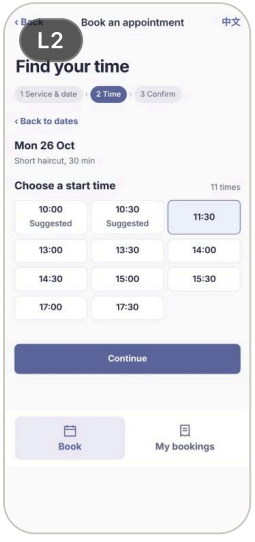

Book

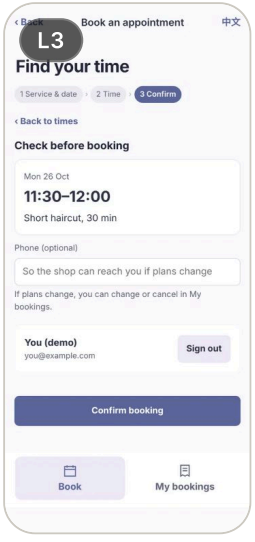

My bookings

Key flow Book → three steps

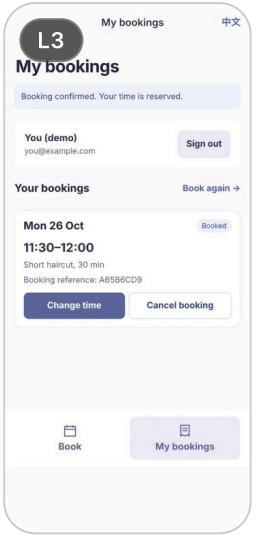

01 — 02 — 03

Choose a time

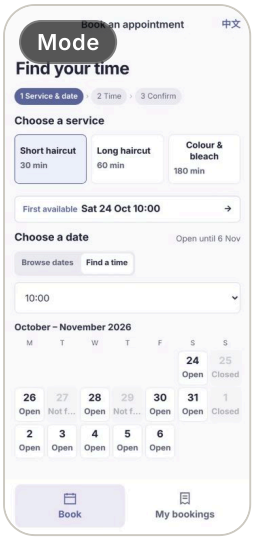

Check before booking

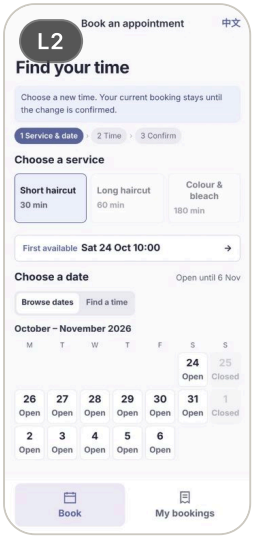

Booked

Book → search by time of day

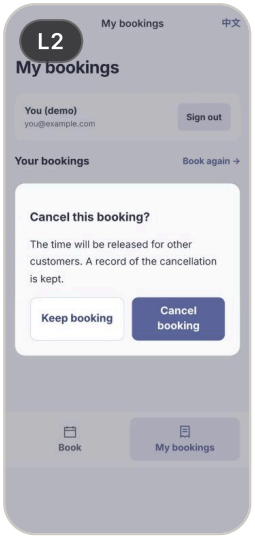

By time of day

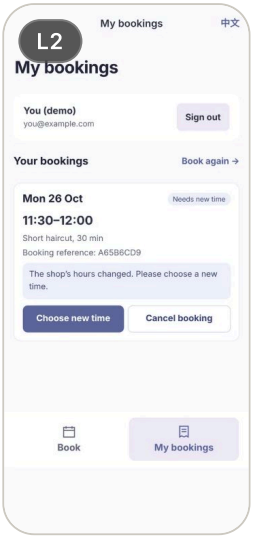

My bookings → change of plan

Change time

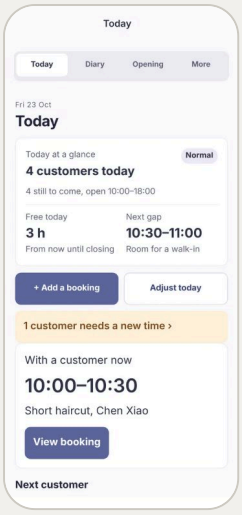

Cancel

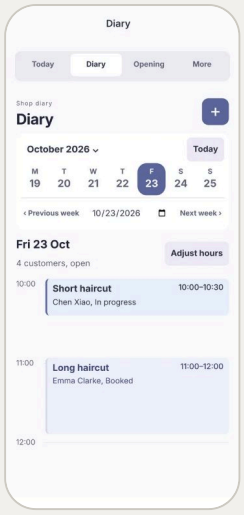

Shop closed: pick again

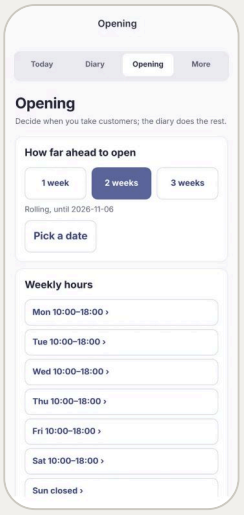

L1 Tab bar

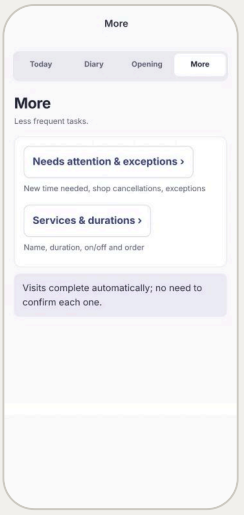

Today

Diary

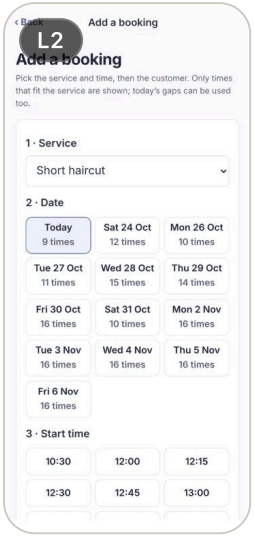

Opening

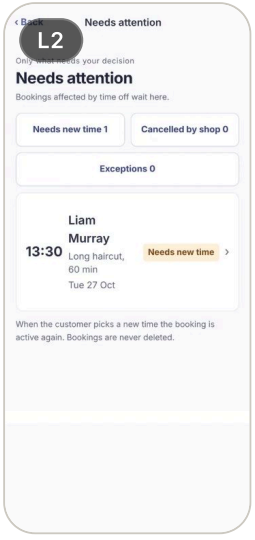

More

Key flow Today → the owner's routine

01 — 02

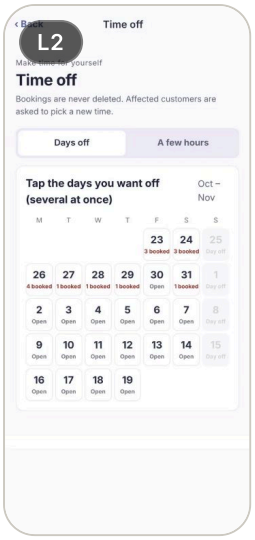

Add a booking

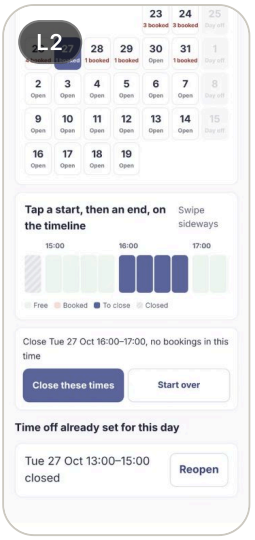

Needs a new time

Key flow Opening → time off without deleting bookings

01 02

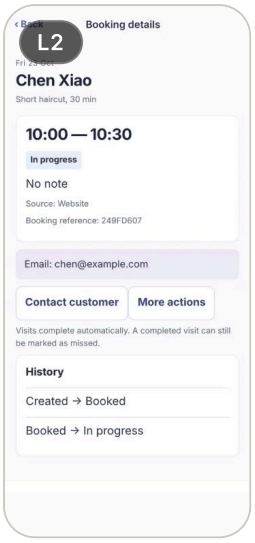

Several days off

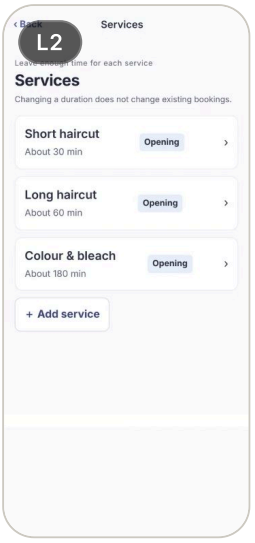

A few hours, on a timeline

Schedule & More

A day in the diary

Services & durations

06 / The end-to-end journey

01

Choose

Select a service and available date.

↓

02

Check

See starts that fit the full duration.

03

Confirm

Review service, duration and local time.

04

Manage

Find the same appointment in My bookings and the shop diary.

05

Recover

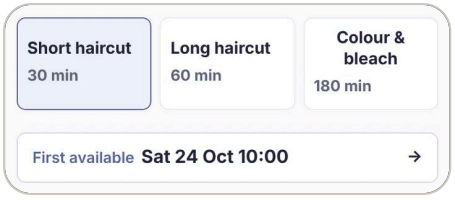

If hours change, retain the booking and arrange a new time.

Back preserves a valid selection. Changing the service or date clears an incompatible time. Rescheduling reuses the selection flow; cancellation requires its own confirmation.

---

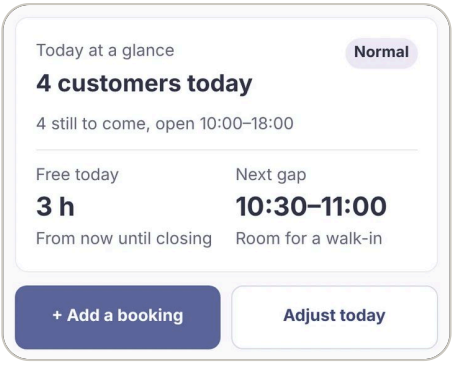

07 / Design details

Close-ups of the decisions that carry the product. Select any image to enlarge it.

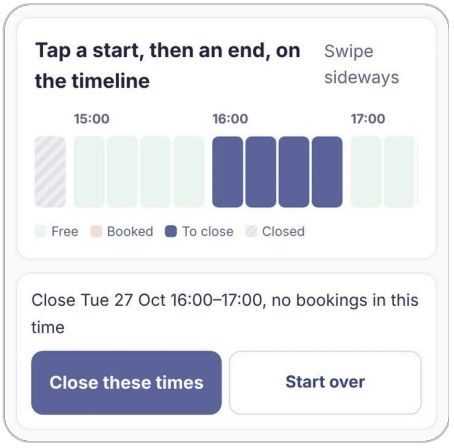

Duration is chosen first

Each service shows its length, and the earliest free time updates with it, because duration decides what fits.

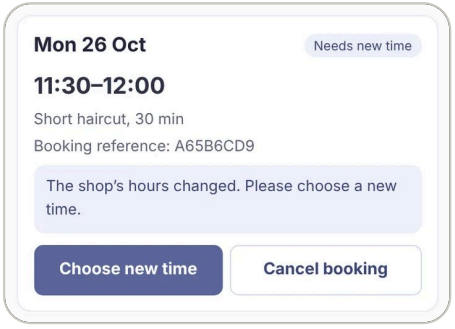

Today, answered in one card

How many customers, how much time is still free and the next gap for a walk-in — the questions she asks every morning — with Add and Adjust one tap away.

Close a few hours on a timeline

Tap a start, then an end, in 15-minute steps. Bookings and earlier closures are marked, and the summary says who is affected before anything closes — bookings are never deleted.

Customers see why, and what to do

A closure turns the booking into "Needs new time" with a one-tap way to choose again.

---

08 / How it was built

The logic was fixed before any screen: pain points, V1 scope, three user flows, then technical rules for the AI tools. Visual polish came last.

01

One booking core

Availability, booking, rescheduling, closures and admin actions live in one shared

02

Guardrails for AI

A written spec, folder rules and a list of what the AI may and may not change kept

TypeScript core used by both sides.

generated code inside the design.

03

Two front ends

A customer flow and a shop diary, both phone-sized; the target is a WeChat mini program with a separate entry for non-WeChat customers.

04

Launched on the web

The first release is a website, not yet the mini program: Chinese and English booking pages and an owner admin share one database, and every booking is re-checked on the server. Browsing is open; booking needs a Google sign-in.

05

Public demo

The live website's own screens and booking rules run in the browser on sample data, in Chinese and English, so anyone can try both sides without touching real bookings.

107

automated tests, incl. 20 requests racing for one slot

4

tabs for the owner

3

steps for a customer to book

> **Limits**
>
> Tests check the rules; they do not show that the owner finds it easy. Real phones, the WeChat in-app browser and launch bugs are being worked through now.

---

09 / Challenges, gaps & opportunities

What is hard

A low-confidence user

The owner is used to WeChat and a paper diary. Every extra step is a reason to go back to them, so the shop side had to shrink to four tabs.

Durations are uncertain

Hair length and colour change how long a service takes, so estimates can still overrun.

Two kinds of customer

WeChat suits Chinese customers but not everyone else, and Google sign-in may not work inside WeChat. Launching on the web with Chinese and English pages serves both, at the cost of that sign-in friction.

Not done yet

- Post-launch fixes are built and tested, waiting for the next deploy
- Testing on real iPhone, Android and the WeChat in-app browser (which may block Google sign-in)
- No SMS or email reminders yet
- Structured interview and observation with the owner
- Free hosting tier: some queries sit above its CPU guideline

Opportunities

Fewer messages

If customers can see free times themselves, most “are you open?” messages disappear.

A wider local audience

A non-WeChat entry opens the shop to local customers who would never add a private WeChat.

A pattern for other small shops

The same core could serve other one-person services with changing hours.

How success would be measured

- ◎ Owner tasks in four taps or fewer
- ◎ Share of bookings made without chatting
- ◎ Time spent rescheduling after a closure
- ◎ Owner still using it after a month

Proposed measures for a pilot, not results.

10 / Validation plan

Planned fieldwork · no findings claimed yet

The next phase connects the prototype to real people and settings. The following is a research plan, not a report of completed activities.

01

Observe a real booking

With permission, map how a request moves from a conversation to the diary, including changes and interruptions. Record steps without retaining private customer details.

02

Validate the operating rules

Confirm service lengths, opening windows, same-day policy, buffers and preferred language with the owner. Demo fixtures are not final business rules.

03

Test both sides of a change

Ask a customer to book and reschedule, then ask the owner to adjust a period and identify affected appointments. Record completion, errors, time and assistance.

11 / Progress & release plan

The live website serves real customers in Chinese and English, with an owner admin, on one shared database (Cloudflare Pages + D1) and Google sign-in. It was checked end to end in production with real accounts: a booking, a reschedule and a cancellation showed up on every side. The prototype on this page runs the same rules in the browser on sample data. The WeChat mini program and automatic reminders are not released yet.

> **Now · live website: Chinese and English booking + owner admin, one shared database**
>
> Next · fix launch bugs and test on real phones and the WeChat in-app browser
>
> Then · owner interview and observation with real use; anonymous usage stats on this page

> Later · reminders and the WeChat mini program on the same booking core

---

Being live is not proof that it works well for the owner or her customers. That still needs real-use data and the owner interview.
